Data Quality & Reconciliation

Period to 2026-09-30 · Demo Client

Prepared for	Demo Client
Engagement	DEMO-0010
Report date	11 November 2026
Version	1.0
Prepared by	ProQuant Analytics · info@proquantanalytics.com
Run ID	dq_20261111T142224Z_ec7a87

Executive summary

Demonstration report. Built entirely from synthetic data generated by ProQuant for illustration. The company, the customers, the banks and the transactions are fictitious.

ProQuant Analytics reviewed the finance data of Demo Client to answer two questions before anyone relies on the numbers: is the data fit for use, and do the systems agree? Quality was measured on the files exactly as received, with 23 rules and control totals that prove whether the extracts are complete. The ledger was then matched with the bank at 2026-09-30, every open item was diagnosed, and each account was proved to the cent.

Overall view: Data and reconciliations cannot yet be relied on

3 of 22 tests passed, 6 with a warning, 13 failed. Conclusions are drafted from the figures and reviewed by the analyst before release.

DATA-QUALITY SCORE	RECORDS MATCHED	ACCOUNTS EXPLAINED
96.5	98.1%	3 of 4
23 rules · 7 fail	13,550 of 13,810	13k USD unexplained

OPEN ITEMS, NOT TIMING	OLDER THAN 90 DAYS	COMPLETE EXTRACTS
151	58	2 short
407k USD · 78 timing	89% older than 30 days	1 day(s) fail the balance proof

Conclusions

- **Headline** 7,378 ledger entries and 6,940 bank lines on 4 accounts were reconciled at 2026-09-30: 98.1% of the records and 97.1% of the value matched with no break; 229 items stand between the books and the bank, worth USD 638k, of which USD 407k are not timing.
- **Completeness** The extracts are not complete: ledger 2026-08 is 23 rows short of its control total; bank 2026-07 is 5 rows short of its control total. The bank balance fails to roll forward on 1 day(s).
- **Data quality** The data-quality score is 96.5 of 100 on 23 rules; 7 rule(s) fail, 1 of them critical. Worst rules: Reference is in the agreed form (3,795 rows); Issue date is in ISO form (1,839 rows); Invoice points to an active customer (354 rows).
- **Master data** 52 pairs of customers look like duplicates (6.2% of the master) and 25 IBANs fail their check digits. A bad IBAN is a payment that fails or reaches the wrong account.
- **Migration** Since the move to ERP-B 35.2% of the rows break a critical or major rule, against 0.7% on ERP-A; the match rate of ledger entries fell from 98.1% to 97.9%. Dates, reference formats and blank fields explain it.
- **Statements** 3 of 4 accounts are fully explained. BA-EUR-01 has +11,629.54 EUR unexplained.
- **Breaks** Largest causes of real breaks: Wrong account (12 items, USD 106k); Duplicate posting (14 items, USD 76k); Transposed digits (8 items, USD 62k). 58 item(s) are older than 90 days. 78 items are only timing and clear on their own.
- **Receivables** The subledger and the control account differ by USD 14k at the period end; the difference first appears in 2026-08.

- **Effort** Clearing these breaks takes about 9 hours a month, about USD 4,711 a year. The three largest causes are 44% of the hours.
- **Overall** Data and reconciliations cannot yet be relied on: 3 tests passed, 6 with a warning, 13 failed. Priority actions: Ask for the missing rows and add a control total to every extract. Ask the bank for the missing statement lines; the balance proves they exist.
- **Analyst** Illustrative note (synthetic data): the finance controller confirms that the interface was re-run by hand on 14 August after a time-out.
- **Analyst** Illustrative note (synthetic data): the bank has been asked for the BA-EUR-01 statement of 22 July.

Actions

Test	Status	Action
Months where an extract differs from its control total	FAIL	Ask for the missing rows and add a control total to every extract.
Days where the bank balance does not roll forward	FAIL	Ask the bank for the missing statement lines; the balance proves they exist.
Customers with a likely duplicate	FAIL	Review the candidate pairs with the master-data owner and merge.
Customers with an invalid IBAN	FAIL	Correct the IBANs and validate them at entry; a bad IBAN is a failed or misdirected payment.
Failure rate of the new system against the old	FAIL	Fix the ERP-B interface: date format, reference format, mandatory fields.
Accounts with an unexplained difference	FAIL	Do not sign this account until the difference is explained.
Receivables subledger against the control account	FAIL	Find the manual journal behind the difference and post it through the subledger.
Open errors and unknowns against the value of the period	FAIL	Clear the break tracker by priority, with owners and dates.
Open items older than 30 days	FAIL	Review aged items weekly until they are gone.
Open items older than 90 days (not timing)	FAIL	Escalate items over 90 days to the finance controller.
Unidentified bank items	FAIL	Identify the senders; hold in suspense and follow the unclaimed-funds policy.
Duplicate postings	FAIL	Reverse the second postings and add a duplicate check to the interface.
Items at the bank never booked	FAIL	Book the items and add a monthly routine for charges and interest.
Extracts delivered late	WARN	Agree delivery dates with the source owners and add an alert for a late file.
Overall data-quality score	WARN	Start with the rules that fail most, by owner; see the issue list.
Critical rules that fail	WARN	Fix the critical rules first: they break the reconciliation or the payment.
Invoices with an unknown customer	WARN	Create or correct the customers and block invoices without a valid customer.
Value matched with no break	WARN	Clear the largest open items first.
Accounts fully explained	WARN	Explain the open difference and sign each statement.

Methodology

This report tells what was found. How each number is built, with formulas and worked examples, is in the methodology document. Two things help when reading on: quality was measured before anything was cleaned, so a problem we repaired still counts; and every account is shown as books, bank and what lies between, down to the last cent.

Results

1. Did everything arrive?

Source	Month	Expected rows	Received	Rows	Expected total	Received total	Total
ledger	2026-08	1,195	1,172	-23	2,565,815.96	2,639,911.16	74,095.20
bank	2026-07	1,308	1,303	-5	2,448,494.01	2,436,864.47	-11,629.54

Source: tables/control_totals_check.csv

The extracts that differ from their control totals. In every other month the rows and the total agree.

Balance proof

Account	Day	Opening	Lines in the file	Closing per the bank	Missing
BA-EUR-01	2026-07-22	2,059,695.36	0.00	2,071,324.90	11,629.54

Source: tables/balance_proof_failures.csv

On these days the bank's balance moves by more than the lines in the file: lines exist that we did not receive.

2. Is the data fit for use?

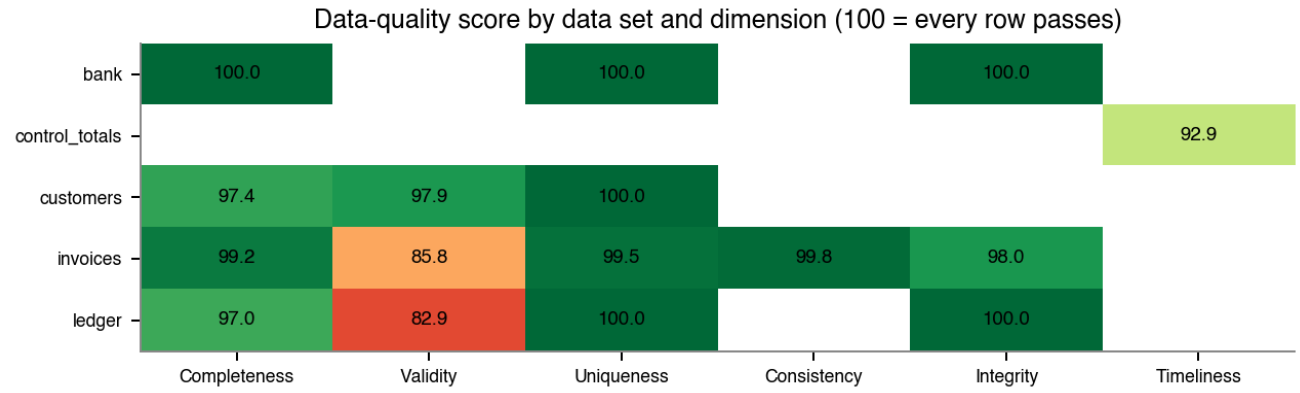

Figure 1. Data-quality score. Source: tables/dq_scorecard.csv

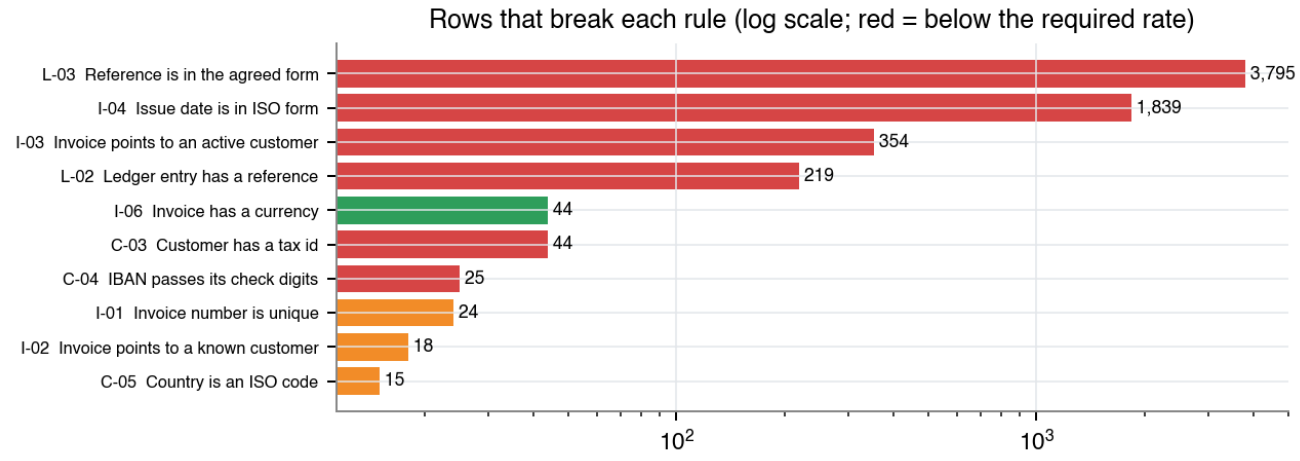

Figure 2. Rules with the most failures. Source: tables/dq_results.csv

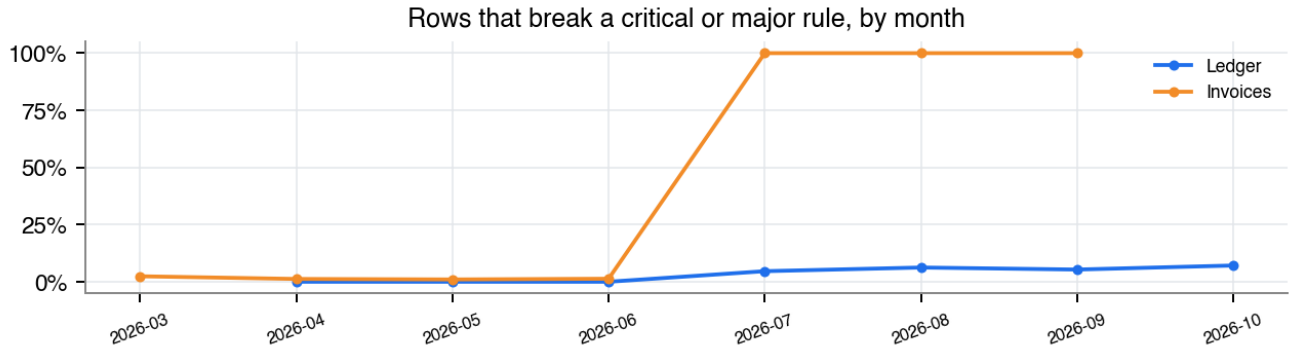

Figure 3. Quality by month: the change comes with the move to the new system. Source: tables/dq_trend.csv

Source: tables/breaks.csv

The full list is in the break tracker, with owners and a status for each.

6. Receivables against the ledger

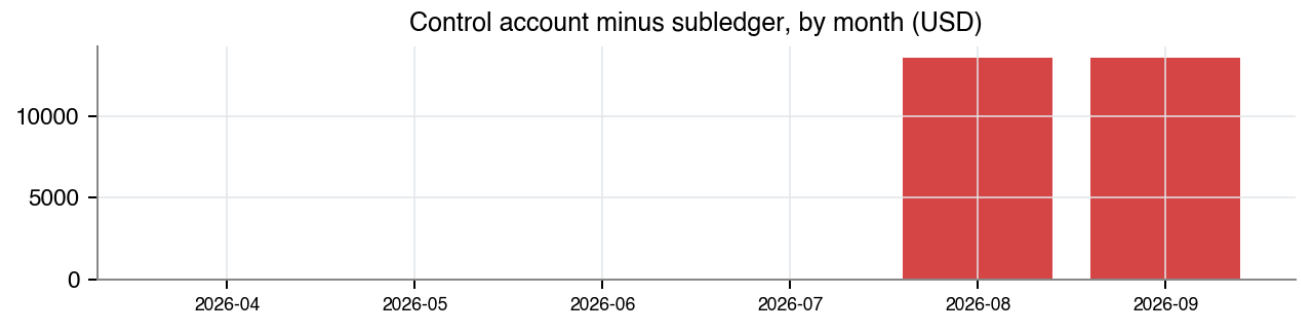

Figure 7. Control account against the invoices. Source: tables/tie_out.csv

Month	Subledger	Control account	Difference	Change	Status
2026-04	2,569,464.20	2,569,464.20	0.00	0.00	PASS
2026-05	3,089,314.17	3,089,314.17	0.00	0.00	PASS
2026-06	3,282,737.68	3,282,737.68	-0.00	-0.00	PASS
2026-07	3,271,343.04	3,271,343.04	-0.00	0.00	PASS
2026-08	3,447,353.26	3,460,984.81	13,631.55	13,631.55	FAIL
2026-09	1,195,989.30	1,209,620.84	13,631.54	-0.01	FAIL

Source: tables/tie_out.csv

A difference that appears in one month and then stays is typically a manual journal to the control account that never reached the subledger. Invoices above the plausible maximum are left out of the subledger here and listed under rule I-05.

7. What it costs

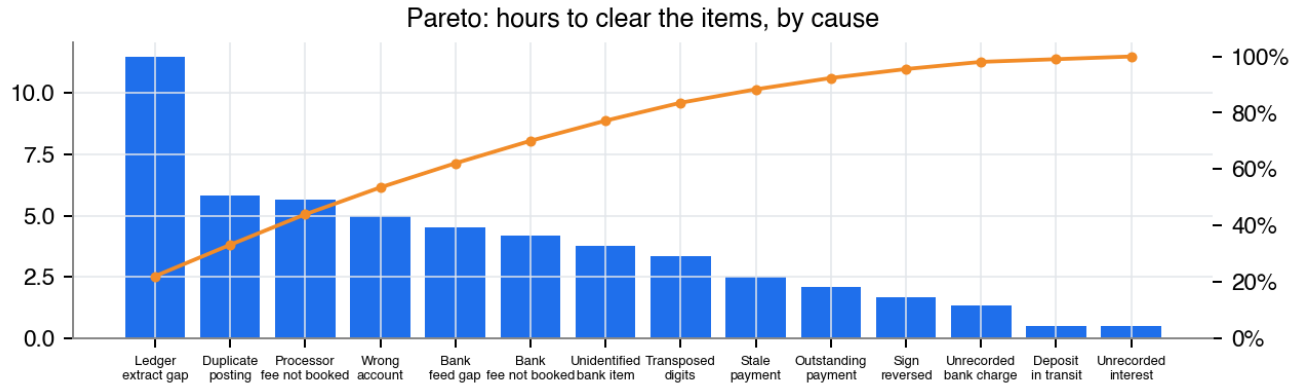

Figure 8. Hours to clear the items, by cause. Source: tables/break_causes.csv

About 9 hours a month for these items. This counts only the clearing of the items, on the minutes agreed at kickoff; it does not count the cost of a wrong number reaching a decision.

8. Rows that could not be used

No row had to be excluded.

9. All tests

Area	Test	Result	Threshold	Status
Completeness	Months where an extract differs from its control total	2 month(s)	warn above 0 month(s), fail above 0 month(s)	FAIL
Completeness	Days where the bank balance does not roll forward	1 day(s)	warn above 0 day(s), fail above 0 day(s)	FAIL
Completeness	Extracts delivered late	7%	warn above 0%, fail above 25%	WARN
Completeness	Rows that could not be used	0.00%	warn above 0.00%, fail above 1.00%	PASS
Data quality	Overall data-quality score	96.5	warn below 99.0, fail below 95.0	WARN
Data quality	Critical rules that fail	1 rule(s)	warn above 0 rule(s), fail above 2 rule(s)	WARN
Data quality	Customers with a likely duplicate	6.2%	warn above 1.0%, fail above 5.0%	FAIL
Data quality	Customers with an invalid IBAN	3.0%	warn above 0.0%, fail above 2.0%	FAIL
Data quality	Invoices with an unknown customer	0.35%	warn above 0.00%, fail above 1.00%	WARN
Data quality	Failure rate of the new system against the old	47.4x	warn above 1.5x, fail above 3.0x	FAIL
Reconciliation	Records matched with no break	98.1%	warn below 97.0%, fail below 90.0%	PASS
Reconciliation	Value matched with no break	97.1%	warn below 98.0%, fail below 92.0%	WARN
Reconciliation	Accounts with an unexplained difference	1 account(s)	warn above 0 account(s), fail above 0 account(s)	FAIL
Reconciliation	Accounts fully explained	75%	warn below 100%, fail below 75%	WARN
Reconciliation	Receivables subledger against the control account	13,632 USD	warn above 0 USD, fail above 10,000 USD	FAIL
Breaks	Open errors and unknowns against the value of the period	2.08%	warn above 0.50%, fail above 2.00%	FAIL
Breaks	Open items older than 30 days	88.7%	warn above 10.0%, fail above 30.0%	FAIL
Breaks	Open items older than 90 days (not timing)	58 item(s)	warn above 0 item(s), fail above 5 item(s)	FAIL
Breaks	Unidentified bank items	55,371 USD	warn above 0 USD, fail above 25,000 USD	FAIL
Breaks	Duplicate postings	76,100 USD	warn above 0 USD, fail above 20,000 USD	FAIL
Breaks	Items at the bank never booked	70 item(s)	warn above 3 item(s), fail above 30 item(s)	FAIL
Effort	Manual hours a month to clear the breaks	9 h	warn above 20 h, fail above 60 h	PASS

Source: tables/tests.csv

Limitations and assumptions

- Control totals are as good as their source: they prove the file agrees with the system, not that the system is right.
- A match is evidence that two records describe one payment, not proof. The loosest passes can pair two unrelated payments of the same amount; each pair records its pass so that it can be reviewed.
- The diagnosis of a break is a best reading of the data. The owner confirms it against the source document.
- Duplicate customers are candidates for review. Two similar names can be two companies.
- Rules measure what they were written to measure. A value can pass every rule and still be wrong.
- Bank data ends a few days after the period end; an item that clears later is shown as open.

Appendix

Cleaning log

step	action	rows_affected
harmonise	references put in one form (INV01234 -> INV-01234)	3688
harmonise	references read from the bank narrative	5828
duplicates	invoice rows sent twice removed	12
harmonise	invoice dates read from dd/mm/yyyy as well as ISO	5261
harmonise	blank invoice currency taken from the customer master	44
